NEW SOUTH WALES

Macquarie University

Project: LE0346888 3-D Optical Surface Profiler

Dr DM Kane Dr MJ Withford Prof CJ Sheppard A/Prof L Zhang Dr W Yeung Dr GL Heness
Prof RG Horn

Partner Organisation(s)

Macquarie University
The University of Sydney
University of Technology, Sydney
University of South Australia

Allocations \$288,000

Abstract

Establishing a state-of-the-science 3-D optical surface profiler will enable macroscopic, microscopic and nanoscopic profiling of surfaces over a very broad range of research programs including, laser cleaning and surface modification, laser precision microfabrication, surface, materials and device characterisation and optical physics applications. The importance and significance of these projects has already been established by the projects having competitive funding. The instrument will undoubtedly support many additional research programs. It is similar to an Atomic-Force-Microscope or stylus profilometer but has significant additional capabilities. These include profiling much larger areas at sub-nanometre resolution and the non-contact nature of the technique.

Project: LE0347245 Functional Genomics Analysis - linking a multicentred facility

A/Prof MR Gillings Prof PL Bergquist Prof IW Dawes Dr R Cavicchioli Prof RJ Trent Dr M Poidinger Prof RJ Scott Prof RJ Aitken Prof RL Raison

Partner Organisation(s)

Macquarie University
The University of New South Wales
The University of Sydney
The University of Newcastle
University of Technology, Sydney

Allocations \$630,000

Abstract

The aim of this project is to enhance and network the functions and activities of the Clive and Vera Ramaciotti Centre for Gene Function Analysis (CGRCGFA), a joint venture that services five major universities in the Sydney-Newcastle area. This application is for equipment that will improve the speed of DNA analyses, and for a laboratory information management system that will standardise the handling of data and sample information at all nodes of the CVRCGFA.

Project: LE0347462 Femtosecond laser micromachining facility
Prof JA Piper Dr MJ Withford Dr GE Town Prof RC McPhedran Dr CM de Sterke A/Prof SC Fleming

Partner Organisation(s)

Macquarie University
The University of Sydney
Australian Photonics CRC

Allocations \$500,000

Abstract

The proposed establishment of a femtosecond laser micromachining facility, with microdiagnostic capabilities, will facilitate a range of projects involving fabrication of submicron structures in metals, polymers, glasses, ceramics and crystalline materials. This facility, unique in Australia, will be comparable to the best such facilities in the world, enabling researchers to apply new microfabrication techniques to a range of photonic and optoelectronic devices, including laser-written optical planar waveguides, nonlinear components and photonic bandgap structures, and various biomedical microstructures. Outcomes will include demonstration and development of novel photonic/optoelectronic devices and of new techniques, crucial to cost-effective manufacture of photonic components.

Total funding for Macquarie University \$1,418,000

The University of New England

Project: LE0346454 Native plant mesocosm facility
Dr PJ Clarke Dr GV Vaughton Dr DA Keith Dr R Bradstock

Partner Organisation(s)

The University of New England
NSW National Parks and Wildlife Service

Allocations \$100,000

Abstract

Mesocosms allow ecological processes to be studied at scales intermediate between the field and laboratory. We will establish a native plant mesocosm, allowing us to accurately manipulate environmental factors such as soil moisture, mineral nutrients and temperature. This will enable us to assess how plants adjust resource allocation patterns and determine genotypic and phenotypic responses to varying environmental conditions. Such research will provide insight into how native plants persist in and adapt to changing environmental conditions. The facility will strengthen existing collaboration with NSW NPWS, enhance post-graduate and post-doctoral training, and provide improved conservation and management outcomes for native plants.

Project: LE0346903 LC-MS system for Faculty of Sciences, UNE
A/Prof SA Glover A/Prof MJ Gunter Dr JR McFarlane Dr PR Grave Dr TC Brown Dr D Backhouse Dr DJ Tucker Dr LL Pereg Gerk Prof DJ Brunckhorst Prof K Watson A/Prof D Lamb A/Prof M Choct A/Prof PC Gregg

Partner Organisation(s)

The University of New England

Allocations \$250,000

Abstract

LC-MS is a technique for investigating the composition of complex mixtures and identifying its components. This instrumentation will be utilised at UNE in a diverse range

of analytical investigations to further the research aims of scientists in chemistry, biological sciences, archaeology, physics, environmental sciences, marine science as well as biological researchers in specialised units based at UNE. The extraordinarily versatile capacity of this technique for analysis and identification of organic substances, from small molecules through to large proteins and complex plant and animal metabolites, will provide impetus for existing research and stimulus for new research directions.

Project: LE0347223 Quantitative PCR facility for New England region of NSW

Dr SW Walkden-Brown Dr LF Le Jambre Dr PJ Groves Dr BF Cheetham Dr RG Windon Dr ME Katz Dr SJ McClure Dr D Backhouse Dr LL Pereg Gerk Dr AF Islam

Partner Organisation(s)

The University of New England
CSIRO Livestock industries
Baiada Poultry Pty. Ltd.

Allocations \$100,000

Abstract

The project will deliver the first real-time PCR facility in the New England Region of NSW for use by University, CSIRO and Industry scientists. The facility will be based at the University of New England and be used by animal scientists, molecular biologists, parasitologists, immunologists and botanists at these institutions, in many cases in collaborative research projects. It will also support the training of seven PhD students and a post-doctoral fellow. The facility will be unique to the region and will remove our current need to use facilities in Brisbane or Sydney.

Total funding for University of New England \$450,000

The University of New South Wales

Project: LE0347049 Building Australian Literary Knowledge Infrastructure

Prof BH Bennett Prof PR Eggert Prof JA Hay Mrs JB Schmidt A/Prof DJ Carter Mr JF Arnold Prof EA Webby Mr RH Coleman Prof GR Worby Dr W Ommundsen Prof DJ Haskell Dr TN Burrows Prof BY Alderman

University of Canberra
The National Library of Australia

Allocations \$403,000

Abstract

The primary goal of AustLit: the Australian Literature Gateway is to facilitate and encourage research in, and teaching of, the nation's creative and critical literature. AustLit's innovative world class resource discovery service utilises best practice techniques in information management and knowledge sharing. In 2003, AustLit will develop new technical services and important new content to meet the defined needs of a wide range of education and information consumers in the area. AustLit provides the foundation for a subject specific digital library that will retain and expand its usefulness.

Project: LE0347130 WorldLII: Australia's lead role in creating global legal research infrastructure
Prof GW Greenleaf Mr AS Mowbray

Partner Organisation(s)
The University of New South Wales
University of Technology, Sydney
CCH Australia Ltd
Australian Business Limited
High Court of Australia

Allocations \$318,000

Abstract
The Australasian Legal Information Institute (AustLII) will lead the development of an online global legal research facility ('WorldLII' - the World Legal Information Institute), in cooperation with an international consortium of other free access providers of legal information. While doing so, we will extend the quantity and quality of AustLII as Australia's only national legal research infrastructure, and integrate its content into the emerging WorldLII global structure and standards. The result will be a comprehensive system for global Internet legal research.

Project: LE0347403 An ultra-wideband digital filterbank for the Mopra Radiotelescope
Prof JW Storey Dr MG Burton Dr RJ Sault Dr PD Godfrey Dr AJ Green

Partner Organisation(s)
The University of New South Wales
Monash University
The University of Sydney
CSIRO - Australia Telescope National Facility

Allocations \$222,000

Abstract
We seek funding to equip the Mopra radiotelescope with an ultra-wide-bandwidth digital filter bank. This will greatly improve the efficiency of the observatory, increasing the speed at which spectroscopic data is acquired by a factor of 8, and the speed of acquiring continuum data by a factor of 32. Once equipped in this way, Mopra, which is already the largest millimetre-wave radiotelescope in the southern hemisphere, will enjoy an unbeatable edge over all other competing observatories around the world through its combination of collecting area and bandpass.

Total funding for University of New South Wales \$943,000

Project: LE0347603 Integrated Facility for Interfacial Rheology Analysis
Dr AV Nguyen A/Prof GM Evans Prof GJ Jameson Prof J Ralston Prof GW Stevens A/Prof KP Galvin A/Prof SR Biggs A/Prof DE Dunstan A/Prof D Fornasiero Dr DA Beattie A/Prof BZ Dlugogorski Dr GV Franks

Partner Organisation(s)
The University of Newcastle
The University of Melbourne
University of South Australia

Allocations \$260,876

Abstract

This proposal seeks to establish a state-of-the-art facility for interfacial rheology analysis. The proposed facility will be unique in Australia and bring together leading researchers from the Universities of Newcastle, Melbourne and South Australia. The facility will allow direct measurements of physical properties at fluid-liquid interfaces which are needed for ongoing research in froth flotation, food processing and surfactant applications as well as to develop new processes in emerging fields of nanotechnology, biotechnology, and medical and pharmaceutical production.

The Australian National University
The University of Melbourne
University of South Australia
RMIT University
University of Canberra

Allocations \$507,000**Abstract**

X-ray absorption spectroscopy (XAS) is an extremely important synchrotron radiation tool for determining the local structure around an X-ray absorbing atom. This has many applications in the study of materials, minerals, metal complexes, and metalloproteins and can often be used to obtain information that is not available by other techniques, because structural information can be obtained in the solid or solution state and in mixtures. The current proposal is aimed at introducing new technology into the Australian National Beamline Facility that will greatly improve the quality and quantity of experiments that can be performed and extend studies into dilute solutions and protein samples.

Project: LE0346733 Ultra-Sensitive CCD Diffractometer with High Intensity X-ray Photon Generator

Prof TW Hambley Dr CJ Kepert Dr P Turner Dr DE Hibbs Prof MA Spackman Prof PA Williams Prof SG Pyne Dr AC Try

Partner Organisation(s)

The University of Sydney
The University of New England
University of Western Sydney
University of Wollongong
Macquarie University

Allocations \$399,466**Abstract**

X-ray photon diffraction from single crystals provides the most accurate, precise and detailed three dimensional chemical structure information. It is however often difficult to

obtain crystals of complex chemical assemblies, such as those used in nanotechnology and photon technology, suitable for diffraction analysis using equipment currently available at Australian chemical crystal structure facilities. The collaborating institutions seek to overcome this problem by purchasing a high sensitivity CCD area detector coupled to an intense laboratory source of X-ray photons. The installation of the equipment would be the first of its kind at an Australian facility and only the fourth worldwide.

Project: LE0346822 Polymer Optical Fibre Drawing Facility
Dr MA van Eijkelenborg Dr L Poladian Prof BT Luther-Davies Dr GD Peng Dr F Ladouceur

Partner Organisation(s)
The University of Sydney
The Australian National University
The University of New South Wales
The Bandwidth Foundry Pty Ltd

Allocations \$538,000

Abstract
A revolutionary new technology is emerging in polymer optical fibres, sparked by an important breakthrough in polymer optical fibres that was achieved last year by researchers at the University of Sydney. Therefore, Australia currently has a unique and short-lived opportunity to firmly establish themselves as the world leaders of this technology, provided the infrastructure to realise the novel concepts is available. We request funding for a high-quality polymer optical fibre draw tower to enable this. The collaborating institutions will be fabricating a range of different polymer optical fibres, targeting specific applications in optical sensing and telecommunications.

Project: LE0346848 Quadriga system for research archive of Asia-Pacific region audio recordings

Partner Organisation(s)
The University of Sydney
The University of Melbourne
The Australian National University

Allocations \$268,000

Abstract
The equipment allows state-of-the-art digitisation of researchers' field recordings of endangered languages and musics of the Asia-Pacific area. Significant and endangered analogue recordings will be prioritised. As well as preserving unique and valuable cultural materials in archival-standard digital formats, the system will provide CD-audio quality access copies for transcription, analysis and community access.

Project: LE0346854 The International Ocean Drilling Program - Australian Collaboration
A/Prof JB Keene

Partner Organisation(s)
The University of Sydney
AVCC
Geosciences Australia
CSIRO - Exploration & Mining

Allocations \$1,363,123

Abstract

The Ocean Drilling Program is supported by 21 countries. Australia contributes as a 1/3 member of a consortium with Canada, Chinese Taipei, Korea. The drillship JOIDES Resolution is the unique facility allowing researchers access to the environmental and geological data recorded in the seafloor. 2003 is the final year of the Program. The ship, during this historic year, will be drilling sites of international importance in the study of oceanic crust generation; past extreme climates linked to mass extinctions; past ocean chemistry and circulation; and the formation of continental margins. Fourteen Australian Universities, CSIRO and AGSO support ODP and provide scientists for pre- and post-drilling research and postgraduate training.

Project: LE0346882 A Micro-CT facility for non-destructive 3D X-ray microscopy of opaque materials

Dr AS Jones A/Prof PR Munroe Prof BK Milthorpe Prof AM Darendeliler Prof DT Potts Prof MV Swain A/Prof MF Barbetti

Partner Organisation(s)

The University of Sydney
The University of New South Wales

Allocations \$296,000

Abstract

This project will establish a Micro-CT facility for non-destructive 3D X-ray microscopy of the internal structure of materials. The facility will support research from a broad spectrum of disciplines and extend regional microscopy and microanalysis capabilities. With a resolution of 1.8µm this instrument will provide 3D images with virtually no sample preparation. The range of materials that this applies to includes minerals, wood, biomaterials, polymers, composites, archaeological ceramics and mummified tissue, and biological materials such as bone, teeth and coral. This facilitates research which had been considered too difficult because of the sample preparation needed to examine internal structure.

Project: LE0346889 Optical fibre fabrication and characterisation facility for next-generation photonics research

A/Prof SC Fleming Prof JD Love Dr ST Huntington Prof JA Piper Prof GW Barton Adj/Prof MG Sceats Dr I Mann Dr BJ Eggleton Dr AL Carter

Partner Organisation(s)

The University of Sydney
The Australian National University
The University of Melbourne
Macquarie University
The Bandwidth Foundry P/L
Redfern Photonics Pty Ltd
Nufern Inc

Allocations \$670,000

Abstract

Australia is a world leader in photonics, underpinning the future of information communications technologies. ICT research demands the next generation of optical fibres; requiring high precision, state-of-the-art fibre fabrication and characterization equipment for advanced research into new photonic materials and technologies. OFTC is the keystone supplier of application specific optical fibre to almost all photonics related research and developing industry in Australia. New equipment will enable OFTC to lead innovation and a high level of excellence in research in fundamental science, new

technologies, new fibre including non-linear and photonic-bandgap, fibre devices, lasers and amplifiers, and support commercial development in Australia.

Project: LE0347140 Picosecond optical probing and characterization of infrared and visible devices

Dr BJ Eggleton Dr JM Dawes Dr CM de Sterke

Partner Organisation(s)

The University of Sydney
Macquarie University

Allocations \$208,000

Abstract

The facility consists of a laser to generate short infrared pulses, and an oscilloscope and detectors to measure such pulses. It will be used to characterize and investigate a new generation of novel optical fibre devices and microstructures, which are to form the basis of the next generation of telecommunications systems, and also novel and unique laser types. The research and development of all of these devices are receiving external funding (or are in negotiations therefore). The facility allows for high-speed and high-accuracy data acquisition, which makes it unique in Australia.

Project: LE0347237 Australian Membership of the International Gemini Partnership

Dr JG Robertson

Partner Organisation(s)

The University of Sydney
The Australian National University
The University of New South Wales
The University of Melbourne
Australia Telescope National Facility (CSIRO)
Swinburne University of Technology
University of Southern Queensland

Allocations \$1,855,121

Abstract

The International Gemini Partnership is an intergovernmental consortium formed to construct and operate two 8-metre optical/infrared telescopes, one in Chile and the other in Hawaii. Australia joined the IGP in May 1998, taking approximately 5% of the partnership. The Gemini telescopes have been carefully engineered to exploit the superb atmospheric conditions at both sites, allowing users to address key astronomical problems in ways not previously possible. Through membership of Gemini, Australian astronomers have access to the world-class facilities necessary to maintain their high international profile and the great public visibility in Galactic and extragalactic astronomy, and also to enhance the national capacity to construct advanced scientific instrumentation.

Partner Organisation(s)

University of Western Sydney
The University of New South Wales
The University of Sydney
Victorian College of the Arts

Allocations \$130,000

Abstract

The equipment establishes an integrated movement analysis laboratory and audience response facility to support and extend ongoing collaborative research projects that investigate human visual and auditory communication through gestures of voice and body. This laboratory will allow recording and analysis of fine and gross motor activity in: caregiver-infant and therapist-client interaction; auditory-visual speech perception; audience reactions to gesture and dance. The audience response facility, a portable system of small keypads programmed to record discrete and continuous responses, brings precision to recording psychological responses in a naturalistic setting. The combined equipment allows concerted investigation of human communicative gesture.

Allocations \$240,000

Abstract

Neutron scattering is one of the most powerful and important investigative tools in the study of materials. Australia has only a low-flux neutron source, HIFAR, which provides no cold or hot neutrons. This excludes large, important areas of science, such as functional films, polymers, self-assembly systems, biological materials, colloids and emulsions, and real-time in-situ studies. This application aims to continue Australia's partnership with the world's most intense neutron source, ISIS in the UK, in order to sustain the considerable Australian scientific momentum which now relies on ISIS. The outcomes will be new science that cannot be generated solely within Australia.

Survey Research Facility**

Dr K Reed Dr BJ Blunsdon Prof JF Lowe Dr S McEachern

Partner Organisation(s)

Deakin University
University of Ballarat

Allocations \$110,000

Abstract

The aim of this project is to establish a statewide survey research facility that enables academics in Victoria to undertake survey research that achieves world best practice technical standards. It will include three facilities for computer based surveying: CATI (computer-assisted telephone interviewing), CAPI (computer-assisted personal interviewing), and CADi (computer-assisted data input). The facility will include a network hub to be based at Deakin University. This hub would then coordinate a network of satellite facilities designed as mobile operations, to enable movement of the facilities between campuses. The facility would enable high quality, best practice survey research across all regions of Victoria.

Curtin University of Technology
The University of New England
The University of Sydney

Allocations \$100,000**Abstract**

The world is ensnared in the legacies of 19th-century colonialism. Whether in international relations (e.g., the borders of Afghanistan) or critical theory (Edward Said and followers), the "colonial project" affects our lives. Yet many seminal documents from which "the colonial" grew are rare and seldom read, even by researchers. Using experience developed and used in earlier projects, this project will identify a dozen such seminal documents from the British experience in South Asia, digitize them, index them, give them contextual notes and put them on the Web to enhance the access and understanding of Australian and international scholars.

Project: LE0347024 Research facility in micromanipulation

A/Prof B Shirinzadeh A/Prof S Nahavandi Dr G Alici Prof JA Smith Dr HM Trinh

Partner Organisation(s)

Monash University

Deakin University

Allocations \$140,000

Abstract

The aim of the program is to establish a unique joint facility between Monash and Deakin for micromanipulation research. The proposed facility will consist of complex/intelligent micromanipulation systems capable of motion accuracy of 0.01-0.1 micrometer (10-100 nm). This will be the only facility of its kind in Australia and will provide a key enabling technology in the research and development of advanced micromanipulation systems, robotic-assisted microsurgery, sensory-based and intelligent control of complex systems, micro assembly/manufacturing, telerobotics/telesurgery, kinematics and dynamics of micromanipulators, laser-based control, and biotechnology. The facility will support and enhance a number of high-quality, current and future research projects with recognised potential.

Swinburne University of Technology

Victorian Partnership for Advanced Computing

Monash University

The University of Melbourne

La Trobe University

RMIT University

University of Ballarat

Allocations \$950,000

Abstract

The aim of the High Performance Computing Facility is to operate a world class facility as measured by both computational power and client satisfaction. This proposal seeks to increase the current computational power of the existing Victorian High Performance Computing Facility by doubling the current capacity. The combination of a large number of very fast processors and a very fast interconnect makes this facility ideal for modelling and solving science and engineering problems beyond the scope of installed HPC systems. The facility will be linked to other HPC systems in Victoria and across Australia to create an evolving cluster computing "meta-centre" that links computing resources together.

Project: LE0347356 Real-time multi-dimensional multi-photon microscopy facility

Prof M Gu Dr SM Russell Dr HE Richardson Dr RA Ashman Ms S Ellis

Partner Organisation(s)

Swinburne University of Technology
The University of Melbourne

Allocations \$238,000

Abstract

The proposal seeks to establish an integrated microscopy facility and thus to expand the high-resolution imaging capabilities at Swinburne University of Technology, Peter MacCallum Cancer Institute and the University of Melbourne. The provision of the equipment requested will establish an innovative real-time multi-dimensional multi-photon imaging facility of world class. This facility will be accessed on a cooperative basis by the participants and will be available for collaborative projects with other Australian institutions and industry. The requested equipment will be used in conjunction with existing femtosecond laser and lifetime imaging systems installed in the research laboratories of the participating institutions. The facility will enable real-time investigations of biomolecular processes and the development of novel biomedical imaging techniques as well as the state-of-the-art nanophotonic devices such as nano-tweezers and nano compact disks.

Project: LE0347970 Integrated Bio-nano-fabrication Facility

A/Prof DV Nicolau A/Prof PC Mulvaney Dr E Ivanova Prof YS Morsi

Partner Organisation(s)

Swinburne University of Technology
The University of Melbourne

Allocations \$186,000

Abstract

The project proposes the upgrade of a joint facility for the probing, fabrication and operation of hybrid bio-nano-devices. The facility will enhance the proposers' capabilities in the area of the fundamental and prototype-type research on biomolecular/cellular devices. The ultimate goal of these projects is to thrust Australian science in the era when the essential functions of cells can be replicated and controlled on devices that are smaller than living cells. The proposed facility has a modular structure consisting of additional nano-positioning, confocal microscope and zeta potential modules built on the existent laser tweezers/scissors, picoliter pipette and Atomic Force Microscope modules.

Dr GG Qiao Prof RA Shanks Dr X Zhang Dr JJ Cooper-White

Partner Organisation(s)

The University of Melbourne
RMIT University
CSIRO - Manufacturing Science & Technology

Allocations \$200,000

Abstract

The proposed facility is essential for characterization of the new polymeric architectures such as copolymers for tissue engineering, nanogels for automotive paints and biodegradable polymeric packaging. The facilities include characterizations of (1) molar mass and molecular sizes of novel polymer architectures (MU); (2) viscoelastic mechanical properties of tensile, bending, bulk and flow (RMIT); and (3) thermal properties of compositions (CSIRO). These new polymeric architectures cannot be sufficiently characterized by existing facilities. The success of the project will significantly enhance the new macromolecular research and facilitate collaborations. This project also falls within the nano and biomaterials of the Designated Priority area of Research.

Project: LE0347466 Australian e-Astronomy
A/Prof RL Webster Dr AJ Green Dr NE Killeen Dr BJ Boyle

Partner Organisation(s)

The University of Melbourne
The University of Sydney
CSIRO-ATNF
Anglo-Australian Observatory

Allocations \$262,000

Abstract

An explosion in the rate of data acquisition in disciplines such as astronomy will require new database structures and management systems. Scientists require fast access and analysis of data from many different telescopes, instruments and theoretical modelling packages. The new directions being explored internationally are based on datagrids, where individual nodes house the physical data archives and expertise, but are networked into a unified system, providing open access to all astronomers. Australian e-Astronomy will provide Phase 1 of a project to develop an astronomy datagrid in Australia, linking to the powerful programs which have just commenced in Europe, UK and the USA.

Project: LE0347775 Support for the Australian Experimental High Energy Physics Program
Prof GN Taylor

Partner Organisation(s)

The University of Melbourne
The University of Sydney
University of Wollongong

Allocations \$247,000

Abstract

High energy particle physics studies the most fundamental constituents of matter. This microscopic frontier requires the highest energy and highest intensity particle accelerators. Through the Big Bang Model, high energy physics also sheds light on the development of the very early Universe. It is thus crucial for the understanding of nature at the very largest of scales as well as the very smallest. The ATLAS and Belle experiments probe two of the most significant questions in fundamental physics: what is the origin of mass, and why do we live in a universe composed of matter rather than antimatter? This proposal seeks support to maintain access to the international high energy physics program in Europe.

Total funding for University of Melbourne \$709,000

Allocations \$290,000

Abstract

This proposal seeks to establish a specialised high framing rate stereoscopic particle image velocimetry (HFR SPIV) facility for the measurement of rapidly changing velocity fields in complex flows. The proposed facility is currently not available in Australia and is significant in that it provides a continuous time sequence of rapidly changing 3D velocity fields in a two-dimensional plane. The facility will provide experimental validation for models and theories developed for fast transient flows in non-periodic time dependent flows, multi-phase flows, solid mechanics and natural convection.

A/Prof PM Fredericks A/Prof GA Hope A/Prof RL Frost Prof GA George

Partner Organisation(s)

Queensland University of Technology
Griffith University
Polymerat Pty Ltd

Allocations \$300,000

Abstract

An Imaging Raman spectrometer generates image maps 10x faster than older instruments and is required to meet escalating demand. This results from innovative use of Raman to characterise organics, polymers, thin films and biomaterials, which underpins rapidly evolving research in nanotechnology and biotechnology. Many innovations have come from QUT's Centre for Instrumental and Developmental Chemistry, which will host the spectrometer and is a key resource for all Queensland universities. The availability of its high quality spectroscopic facility has enabled leading edge developments by local companies and the Imaging Raman spectrometer will significantly accelerate and enhance current and future project outcomes.

Griffith University
Queensland University of Technology

Allocations \$193,000

Abstract

HPLC-ICP-MS is the most reliable cutting edge technology for speciation of metals and metalloids in biological and environmental matrices, and is essential for toxicological studies, which is a major aim behind NRCET's establishment. It will provide a very powerful utility to fill a badly needed knowledge gap for our research and serve the needs of both postgraduate students and postdoctoral fellows. This technology will provide new opportunities in research. It will strengthen our linkages within Faculty of Health Sciences and with our research partners in CQU, QUT and Griffith and enforce our strong national and international reputation.

Project: LE0347262 Upgrading of Wind Tunnel Research Facility with Oxford Lasers VisiSizer

Mr N Woods A/Prof GA Beattie A/Prof SW Adkins Dr JS Hanan A/Prof BN Noller

Partner Organisation(s)

The University of Queensland
University of Western Sydney

Allocations \$150,000

Abstract

Bringing together expertise within five collaborating research Centres in two Universities, an Oxford Lasers VisiSizer will be used to study the atomisation of pesticide sprays and droplet behaviour in moving flow fields. This equipment, in conjunction with the construction of a new working section in a pesticide wind tunnel research facility, will enable the simultaneous measurement of particle size and droplet velocity. The VisiSizer will construct images of the atomisation process and enable the interaction of spray droplets and plant canopies to be studied. Data will support modelling of pesticide transport processes and accelerate leading Australian expertise in pesticide science

Project: LE0347585 Queensland high throughput structural biology screening facility

A/Prof JL Martin A/Prof B Kobe Prof RJ Quinn

Partner Organisation(s)

The University of Queensland
Griffith University

Allocations \$320,000

Abstract

Structural biology is undergoing a worldwide revolution, enabling an enormous acceleration in the rate of protein structure determination. Australia currently lacks facilities to enable this high throughput approach to structural biology. We plan to establish a facility that addresses this deficiency and will enable the structure determination of hundreds of new proteins per year. It will contribute significantly to

structural biology research in Queensland and elsewhere in Australia and also to allied fields of biotechnology, including drug discovery and bioinformatics.

Project: LE0347727 Computational infrastructure for high-throughput genome bioinformatics

Prof MA Ragan Dr Y Chen Dr TL Bailey Dr SM Grimmond A/Prof P Timms

Partner Organisation(s)

The University of Queensland
Queensland University of Technology

Allocations \$400,000

Abstract

We propose a high-performance computing and web facility for genome bioinformatics. It will provide a common software development environment in support of molecular biosciences, systems biology and complex systems modelling at the Institute for Molecular Bioscience at University of Queensland, and at Queensland University of Technology. The platform will support Australia's first genome-scale bioinformatics research website, with unique software and mirrors of the IBM Biological Pattern Discovery, UC San Diego MEME/MetaMEME/MAST, and NGI comparative genomics websites. Australian/NZ researchers will access the facility at no cost for high-throughput use of unique software, website mirrors and other important tools for genome bioinformatics.

Allocations \$500,000

Abstract

Neuroscience is entering an era of accelerated discovery in which Queensland neuroscientists can excel if they gain leadership in key technologies. One critical technology is the ability to obtain specific cell populations from various parts of the nervous system in sufficient quantity and purity to enable their accurate examination by gene array, proteomics and physiological techniques. The aim is to establish the world's first cell-sorting facility dedicated to the production of nerve cells suitable for molecular characterization and screening, providing the basis for identifying key molecules regulating brain function, ageing and repair of great importance to the biotechnology/pharmaceutical industry.

Allocations \$770,000

Abstract

Key aspects of our knowledge of the earth have resulted from isotope measurements using a mass spectrometer. Thermal instruments measure the abundance of isotopes with the greatest accuracy achievable and are the cornerstone of laboratories investigating the earth and its environment. Recently, significant improvements have been made to these instruments in response to the need to solve problems involving a wider range of chemical elements present in small quantities and to measure them with higher precision than ever before. This proposal will establish a state-of-the-art Thermal Ionisation Mass Spectrometer so that Australian scientists can remain internationally competitive in their research.

Project: LE0347945 Extension to Stable Isotope Facility: Elemental Analyser and GC-GC Preparative Systems

Dr K Grice Prof RI Kagi Prof RJ Gilkes A/Prof JP Conroy Dr AW Rate

Partner Organisation(s)

Curtin University of Technology
University of Western Sydney
The University of Western Australia

Allocations \$182,000

Abstract

To carry out compound specific stable isotope analysis, compounds need to be resolved by GC, and with samples such as petroleum, this is uncommon. We therefore seek to explore GC-GC as a novel additional preparative system in isotope ratio mass spectrometry. Within our new State Centre of Excellence we will be confronted with samples such as soils, sediments, and natural organic matter which require examination by bulk isotope analysis. If equipped with a customised elemental analyser as an inlet system, both our existing mass analysers will be capable of measuring carbon, hydrogen, nitrogen, oxygen and sulphur isotope values of whole samples.

Abstract

Interactive Television is a rapidly emerging platform for global media and e-commerce that is poised to dramatically transform the role of television in society. In collaboration with a range of university and industry partners, Murdoch University aims to establish Australia's first dedicated public research laboratory for assessing consumer motivation, evaluating program usability and theorising audience response to Interactive Television applications. The laboratory will feature specialised testing equipment designed to emulate real-world digital broadcasting environments, enabling rich data on viewing behaviour to be collected and analysed. As an independent facility, the laboratory will provide an invaluable resource for academic and industry research.

Dr AJ Crawford Prof RR Large Dr RF Berry Dr DR Cooke Dr LV Danyushevsky Dr GJ Davidson Dr BJ Gemmell Dr VS Kamenetsky

Partner Organisation(s)

University of Tasmania

Allocations \$750,000

Abstract

Compositional data determined on inorganic materials by electron microprobe analysis (EPMA) underpins a considerable amount research in Earth/planetary sciences. Spots down to 2/1000mm may be analysed quantitatively for major elements and some trace elements with an accuracy of <1%, and digital composition maps of the elemental spatial distribution can be generated. Increasing downtime on the 14 year-old UTasmania microprobe, coupled with diverse new and exciting applications in ore deposit research, environmental geoscience and geochronology force us to seek funds to replace the existing EPMA facility, which has logged ~101,000 hours of use involving ~250 researchers, and produced more than 500 refereed papers.

Partner Organisation(s)

The Australian National University

The University of Sydney

University of Wollongong

The University of New South Wales
The University of Newcastle

Allocations \$1,584,000

Abstract

An 800 MHz high-resolution nuclear magnetic resonance (NMR) spectrometer equipped with a triple-resonance cryoprobe is required to support the research of 5 universities in the NSW/ACT area. The high magnetic field of the spectrometer is necessary for the study of proteins, protein-ligand complexes and other biomolecular systems of molecular weight >30,000. Projects previously inaccessible due to sensitivity, solubility or resolution problems will become tractable. The increased turn-around times afforded by the high sensitivity of the cryo-enabled spectrometer make it possible to provide access for Australian institutions that would not otherwise have access to comparable equipment.

Project: LE0346878 GeoWulf: An Inference Engine for Complex Earth Systems

Dr JL Braun Dr M Sambridge Prof AJ Gleadow Dr RW Brown Prof SY O'Reilly A/Prof MC Dentith Dr BR Minty Prof C Beaumont Prof WL Griffin

Partner Organisation(s)

The Australian National University
The University of Melbourne
Macquarie University
The University of Western Australia
Geoscience Australia
Dalhousie University
Cougar Computers Canberra PTY

Allocations \$190,000

Abstract

The project is to build a 'Beowulf' cluster as a platform for solving complex data inference problems in the Earth sciences, and in particular the fields of thermochronology, seismology, crustal and mantle dynamics, and landform evolution. A Beowulf cluster is a network-linked set of commonly available 'off-the-shelf' PC-computers configured to give unprecedented performance/cost ratio. Projects using the Beowulf facility will combine state-of-the-art computational techniques recently developed at ANU, and high quality data sets collected over the past decade to address fundamental questions in the Geosciences.

Project: LE0347079 Surface and strain measurement facilities for the investigation of intelligent CAD approaches

Dr MJ Cardew-Hall Prof PD Hodgson Dr S Kalyanasundaram

Partner Organisation(s)

The Australian National University
Deakin University

Allocations \$160,000

Abstract

The basis of machine learning approaches is the ability to learn or train a system from data gathered through experiments or experience. A major shortcoming in the development and application of such methods is the lack of good quantitative data. Here we propose the acquisition of dimensional and strain measurement facilities that will allow the investigation of such methods in the context of manufacturing - in particular sheet metal components for the automotive industry. The facilities will enable a database

of dimensional and strain information to be established in support of related manufacturing R&D projects.

Project: LE0347131 Intelligent Computer System to Access Information Directly from the Brain Using High Resolution Electroencephalography and Repetitive Transcranial Magnetic Stimulation
Prof AW Snyder Prof MV Srinivasan Prof WA Foley

Partner Organisation(s)
The Australian National University
The University of Sydney

Allocations \$115,490

Abstract
The ambitious aim of this project is to create a novel intelligent computer system which access information from the brain. To do this we use repetitive Transcranial Magnetic Stimulation and high resolution Electroencephalography.

Total funding for Australian National University \$2,049,490

University of Canberra

Project: LE0347247 Optical and Microwave Free-Space Communications Development and Test Facility
Prof PJ Edwards Prof MW Austin Dr LN Binh Dr P Lynam

Partner Organisation(s)
University of Canberra
RMIT University
Monash University
The University of New South Wales
Canberra Institute of Technology

Allocations \$400,000

Abstract
Our aim is to upgrade the capability of the University of Canberra, Monash University, the RMIT University and The University of New South Wales at ADFA to collaborate in the development and testing of next generation ultra-broadband telecommunications and data-communications devices and systems. We will augment existing instrumentation at each of the institutions to enable the collaborative development, testing and system integration of high capacity free-space optical and microwave components. Experimental systems will be tested in the free-space optical communications range and satellite earth station complex situated on the University of Canberra campus.

Total funding for University of Canberra \$400,000

TOTAL FUNDING FOR AUSTRALIAN CAPITAL TERRITORY \$2,449,490

TOTAL FUNDING FOR ALL INSTITUTIONS \$25,213,076
